

Properties of Circles

1) \angle at centre = $2\angle$ at circumference

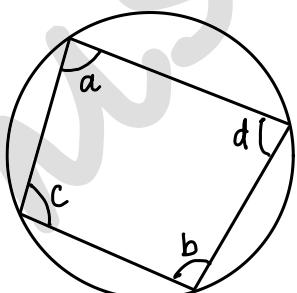

O is centre of circle.

2) \angle s in the same segment

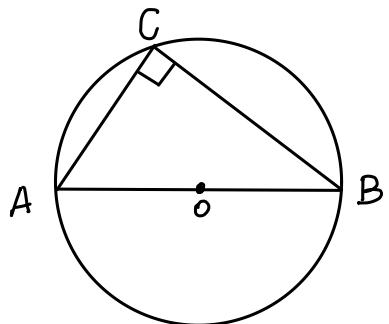

3) \angle s in the opp. segment

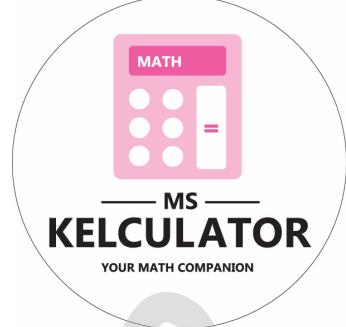

$$\angle a + \angle b = 180^\circ$$

$$\angle c + \angle d = 180^\circ$$

4) Right \angle in semicircle

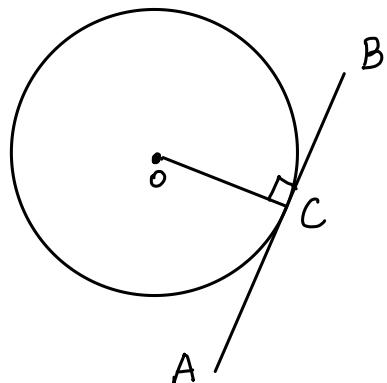

$$\angle ACB = 90^\circ$$

O is the centre of circle.
AB is the diameter of circle.

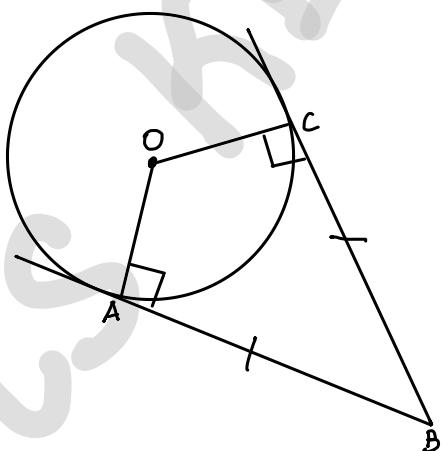

5) Tangent \perp Radius

$$\angle OCB = 90^\circ$$

O is the centre of circle.
AB is the tangent of circle.

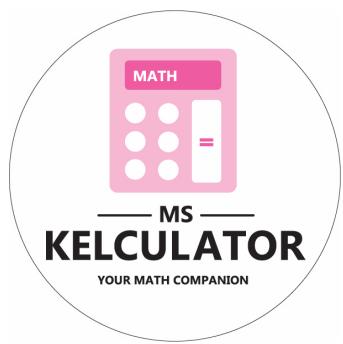

6) Equal tangent from external point

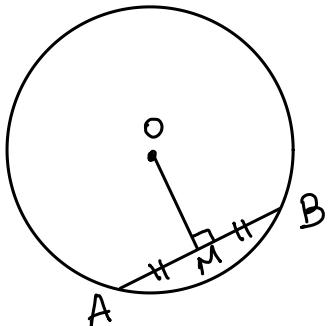

$$AB = BC$$

$$\angle OAB = \angle OCD = 90^\circ$$

O is the centre of circle.
AB and BC are the tangent of circle.

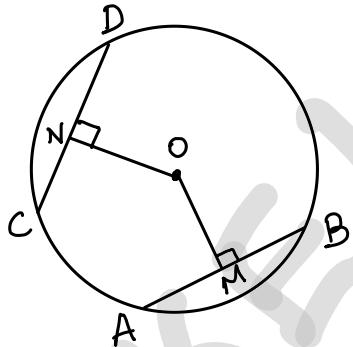

7) \perp bisector of chord

O is the centre of circle.
AB is the chord.

- If $AM = MB$, then $\angle OBM = 90^\circ$
- If $\angle OBM = 90^\circ$, then $AM = MB$.

8) Equal chords

O is the centre of circle.
AB is the chord.
CD is the chord.

- $\underbrace{AB=CD}$ Equal chord
- If $AB = CD$, then $OM = ON$.
 - If $OM = ON$, then $\underbrace{AB = CD}$. Equal chord
